The Authors

Bruce E. Larock, Ph.D., P.E., received his civil engineering degrees at Stanford University. In 1966 he joined the faculty of the Civil and Environmental Engineering Department, University of California, Davis, where he is now a Professor. He has pursued studies in fluid motion primarily by numerical methods, including finite element and finite difference analyses. Dr. Larock has published approximately 80 technical articles, including a co-authored book and several book chapters. A member of the American Society of Civil Engineers, he is currently an associate editor of its Journal of Hydraulic Engineering.

Roland W. Jeppson, Ph.D., is Professor of Civil and Environmental Engineering at Utah State University, Logan, with 33 years of teaching engineering courses there and at California State University, Humboldt, and conducting research at the Utah Water Research Laboratory. A former department Chairman, he is author or co-author of over 70 technical articles and reports and two books. He has served numerous organizations as a consultant and/or expert witness and also developed the USU-NETWK software package for pipe network analysis and design.

Gary Z. Watters, Ph.D., P.E., completed his doctorate at Stanford University in 1963. After 17 years on the faculty at Utah State University, in 1980 Dr. Watters became Dean of Engineering, Computer Science, and Technology at California State University, Chico, for 12 years. He retired as Emeritus Professor in 1998. Dr. Watters has consulted widely and given expert testimony on hydraulic transients for over 30 years. He is the author, co-author, or contributor to, five books and two other book chapters. He is a member of the American Society for Engineering Education and the American Society of Civil Engineers.

ACKNOWLEDGMENTS

Each of the three authors has had a long and continuing involvement with some, indeed most, of the material in this book in one way or another since the time they first became acquainted with each other as graduate students at Stanford University in the 1960s. At that time the teaching and enthusiasm of John K. Vennard for the subject of flow in pipes made a positive impression on us, his then-young students. In the years since then each of us has taught portions of this material to students in university courses, or in short courses, or in both. This book is a long-delayed product of that early enthusiasm, now tempered by years of experience and aided by advances in knowledge about hydraulics and numerical methods and advances in computer hardware. We acknowledge here his influence on our lives and on this book.

We thank Nicole Newman for her skill in preparing, and sometimes repairing, almost three hundred figures for this book, and we particularly appreciate her patience and tolerance as the authors continued to revise some of them even after they were drawn. Her careful attention to detail has resulted in a better book.

We appreciate the support our families have given each of us as we took time from our other activities to find time to pursue this project.

We want to express our heartfelt thanks and gratefully acknowledge the contribution of many, many students, really too numerous to mention individually here, at three universities and in numerous short courses over three decades. They have listened attentively, questioned, probed, and otherwise interacted with the authors in classes, hallways, hydraulics laboratories, and offices over the years as we all sought to understand this subject better and as the materials in this book were developed, refined, and tested. Thanks to all of you!

Bruce E. Larock
Roland W. Jeppson
Gary Z. Watters

TABLE OF CONTENTS

1. Introduction
2. Review of Fundamentals
 - 2.1 The fundamental principles
 - 2.1.1. The basic equations
 - 2.1.2. Energy and Hydraulic Grade Lines
 - 2.2 Head loss formulas
 - 2.2.1. Pipe friction
 - 2.2.2. Darcy-Weisbach equation
 - 2.2.3. Empirical equations
 - 2.2.4. Exponential formula
 - 2.2.5. Local and minor losses
 - 2.3 Pump theory and characteristics
 - 2.4 Steady flow analyses
 - 2.4.1. Series pipe flow
 - 2.4.2. Series pipe flow with pump(s)
 - 2.4.3. Parallel pipe flow, equivalent pipes
 - 2.4.4. Three reservoir problem
 - 2.5 Problems
3. Manifold Flow
 - 3.1 Introduction
 - 3.2 Analysis of manifold flow
 - 3.2.1. No friction
 - 3.2.2. Barrel friction only
 - 3.2.3. Barrel friction with junction losses
 - 3.3 A hydraulic design procedure
 - 3.4 Problems
4. Pipe Network Analysis
 - 4.1 Introduction
 - 4.1.1. Defining an appropriate pipe system
 - 4.1.2. Basic relations between network elements
 - 4.2 Equation systems for steady flow in networks
 - 4.2.1. System of Q -equations
 - 4.2.2. System of H -equations
 - 4.2.3. System of ΔQ -equations
 - 4.3 Pressure reduction and back pressure valves
 - 4.3.1. Q -equations for networks with PRV's/BPV's
 - 4.3.2. H -equations for networks with PRV's/BPV's
 - 4.3.3. ΔQ -equations for networks with PRV's/BPV's
 - 4.4 Solving the network equations
 - 4.4.1. Newton method for large systems of equations
 - 4.4.2. Solving the three equation systems via Newton

- 4.4.3. Computer solutions to networks
- 4.4.4. Including pressure reducing valves
- 4.4.5. Systematic solution of the Q -equations
- 4.4.6. Systematic solution of the H -equations
- 4.4.7. Systematic solution of the ΔQ -equations
- 4.5 Concluding remarks
- 4.6 Problems

5. Design of Pipe Networks

- 5.1 Introduction
 - 5.1.1. Solving for pipe diameters
 - 5.1.2. Solution based on the Darcy-Weisbach equation
 - 5.1.3. Solution based on the Hazen-Williams equation
 - 5.1.4. Branched pipe networks
- 5.2 Large branched systems of pipes
 - 5.2.1. Network layout
 - 5.2.2. Coefficient matrix
 - 5.2.3. Standard Linear Algebra
- 5.3 Looped network design criteria
- 5.4 Designing special components
- 5.5 Developing a solution for any variables
 - 5.5.1. Logic and use of NETWEQS1
 - 5.5.2. Data to describe the pipe system
 - 5.5.3. Combinations that can not be unknowns
- 5.6 Higher order representations of pump curves
 - 5.6.1. Within range polynomial interpolation
 - 5.6.2. Spline function interpolation
- 5.7 Sensitivity analysis
- 5.8 Problems

6. Extended Time Simulations and Economical Design

- 6.1 Introduction
- 6.2 Extended time simulations
- 6.3 Elements of engineering economics
 - 6.3.1. Economics applied to water systems
 - 6.3.2. Least cost
- 6.4 Economic network design
 - 6.4.1. One principal supply source
 - 6.4.2. Design guidelines for complex networks
- 6.5 Problems

7. Introduction to Transient Flow

- 7.1 Causes of transients
- 7.2 Quasi-steady flow
- 7.3 True transients
 - 7.3.1. The Euler equation
 - 7.3.2. Rigid-column flow in constant-diameter pipes
 - 7.3.3. Water hammer
- 7.4 Problems

8. Elastic Theory of Hydraulic Transients (Water Hammer)

- 8.1 The equation for pressure head change ΔH
- 8.2 Wave speed for thin-walled pipes
 - 8.2.1. Net mass inflow

- 8.2.2. Change in liquid volume due to compressibility
- 8.2.3. Change in pipe volume due to elasticity
- 8.3 Wave speeds in other types of conduits
 - 8.3.1. Thick-walled pipes
 - 8.3.2. Circular tunnels
 - 8.3.3. Reinforced concrete pipe
- 8.4 Effect of air entrainment on wave speed
- 8.5 Differential equations of unsteady flow
 - 8.5.1. Conservation of mass
 - 8.5.2. Interpretation of the differential equations
- 8.6 Problems

9. Solution by the Method of Characteristics

- 9.1 Method of characteristics, approximate governing equations
 - 9.1.1. Development of the characteristic equations
 - 9.1.2. The finite difference representation
 - 9.1.3. Setting up the numerical procedure
 - 9.1.4. Computerizing the numerical procedure
 - 9.1.5. Elementary computer programs
- 9.2 Complete method of characteristics
 - 9.2.1. The complete equations
 - 9.2.2. The numerical solution
 - 9.2.3. The Δs - Δt grid
- 9.3 Some parameter effects on solution results
 - 9.3.1. The effect of friction
 - 9.3.2. The effect of the size of N
 - 9.3.3. The effect of pipe slope
 - 9.3.4. Numerical instability and accuracy
- 9.4 Problems

10. Pipe System Transients

- 10.1 Series pipes
 - 10.1.1. Internal boundary conditions
 - 10.1.2. Selection of Δt
 - 10.1.3. The computer program
- 10.2 Branching pipes
 - 10.2.1. Three-pipe junctions
 - 10.2.2. Four-pipe junctions
- 10.3 Interior major losses
- 10.4 Real valves
 - 10.4.1. Valve in the interior of a pipeline
 - 10.4.2. Valve at downstream end of pipe at reservoir
 - 10.4.3. Expressing K_L as a function of time
 - 10.4.4. Linear interpolation
 - 10.4.5. Parabolic interpolation
 - 10.4.6. Transient valve closure effects on pressures
- 10.5 Pressure-reducing valves
 - 10.5.1. Quick-response pressure reducing valves
 - 10.5.2. Slower acting pressure-reducing or pressure-sustaining valves
- 10.6 Wave transmission and reflection at pipe junctions
 - 10.6.1. Series pipe junctions
 - 10.6.2. Tee junctions

- 10.6.3. Dead-end pipes
- 10.7 Column separation and released air
 - 10.7.1. Column separation and released air
 - 10.7.2. Analysis with column separation and released air
- 10.8 Problems

11. Pumps in Pipe Systems

- 11.1 Pump power failure rundown
 - 11.1.1. Setting up the equations for booster pumps
 - 11.1.2. Finding the change in speed
 - 11.1.3. Solving the equations
 - 11.1.4. Setting up the equations for source pumps
- 11.2 Pump startup
- 11.3 Problems

12. Network Transients

- 12.1 Introduction
- 12.2 Rigid-column unsteady flow in networks
 - 12.2.1. The governing equations
 - 12.2.2. Three-pipe problem
- 12.3 A general method for rigid-column unsteady flow in pipe networks
 - 12.3.1. The method
 - 12.3.2. An example
- 12.4 Several pumps supplying a pipe line
- 12.5 Air chambers, surge tanks and standpipes
- 12.6 A fully transient network analysis
 - 12.6.1. The initial steady state solution
 - 12.6.2. TRANSNET
- 12.7 Problems

13. Transient Control Devices and Procedures

- 13.1 Transient problems in pipe systems
 - 13.1.1. Valve movement
 - 13.1.2. Check valves
 - 13.1.3. Air in lines
 - 13.1.4. Pump startup
 - 13.1.5. Pump power failure
- 13.2 Transient control
 - 13.2.1. Controlled valve movement
 - 13.2.2. Check valves
 - 13.2.3. Surge relief valves
 - 13.2.4. Air venting procedures
 - 13.2.5. Surge tanks
 - 13.2.6. Air chambers
 - 13.2.7. Other techniques for surge control
- 13.3 Problems

14. References

Appendices

A. Numerical Methods

- A.1 Introduction
- A.2 Linear algebra

- A.2.1. Gaussian elimination
 - A.2.2. Use of the linear algebra solver SOLVEQ
 - A.3 Numerical integration
 - A.3.1. Trapezoidal rule
 - A.3.2. Simpson's rule
 - A.4 Solutions to ordinary differential equations
 - A.4.1. Introduction
 - A.4.2. Runge-Kutta method
 - A.4.3. Use of the ODE solver ODESDOL
- B. Pump characteristic curves
- C. Valve loss coefficients
 - C.1 Globe and angle valves
 - C.2 Butterfly valves
 - C.3 Ball valves
- D. Answers to selected problems
